Abstracts

Single Chip Imaging Radar refers to a compact, integrated radar system that combines all necessary components—including transmitters, receivers, antennas, and signal processing units—onto a single semiconductor chip, enabling high-resolution imaging and object detection through the emission and reception of radio waves. This technology offers significant advantages in miniaturization, cost efficiency, and scalability compared to traditional multi-chip or discrete radar systems, making it particularly suitable for applications requiring precise spatial awareness, such as automotive advanced driver-assistance systems (ADAS), autonomous vehicles, industrial automation, robotics, and smart infrastructure. By leveraging semiconductor manufacturing processes, single chip imaging radars can achieve finer angular resolution and better distinguish between multiple objects in complex environments, all while maintaining lower power consumption and a smaller form factor.

The global Single Chip Imaging Radar market size was estimated at USD 90.25 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 32.50% during the forecast period.
