Abstracts

A single convoluted air spring is a pneumatic suspension component consisting of a single, large, flexible rubber or elastomeric bellows with metal end fittings, designed to support loads, absorb shocks, and provide adjustable ride height or vibration isolation by varying internal air pressure. It functions as a self-contained air chamber that expands or contracts in response to pressure changes, offering progressive spring rates and adaptable stiffness, making it suitable for applications requiring dynamic load leveling, such as in commercial vehicle suspensions, industrial machinery, rail systems, and specialized automotive aftermarket modifications. Its single convolution design simplifies construction while maintaining durability and responsiveness under varying operational conditions.

The global Single Convoluted Air Spring market size was estimated at USD 510.25 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 4.80% during the forecast period.
