Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Single Core Solar Cable competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. In 2024, global Single Core Solar Cable production reached approximately 6,520,000 kilometers with an average global market price of around US\$ 0.65 per meter, a single-line production capacity of approximately 2,500 km/year, and a gross profit margin of approximately 18%. Single Core Solar Cable is a specialized electrical cable designed for photovoltaic (PV) systems, featuring a single conductor structure to transmit direct current (DC) power between solar panels, combiner boxes, inverters, and other electrical components. The conductor is typically made of high-purity tinned copper to ensure excellent conductivity and resistance to corrosion. The insulation and sheath are usually manufactured from cross-linked polyolefin (XLPO) or low-smoke halogen-free flame-retardant materials, providing superior resistance to UV radiation, high temperatures, weathering, and mechanical stress, which enables long-term reliable performance in harsh outdoor environments. Upstream, key suppliers provide high-conductivity copper rod or aluminium rod (including tinned copper grades), which are drawn into fine wires, plus polymer compounds for insulation and sheathing such as cross-linkable polyolefins (XLPO/XLPE), halogen-free flame-retardant (HFFR) materials, UV- and ozone-resistant elastomers, and additives (antioxidants, stabilisers, fire retardants, pigments) formulated to meet IEC 62930, EN 50618, T?V and UL solar-cable requirements. In the midstream, cable manufacturers convert rod and compounds into finished single core solar cables: they draw and strand conductors, apply extrusion of insulation and outer sheath (often crosslinking in CV lines or electron-beam processes), incorporate optional tinned conductors or double insulation, and perform online monitoring of concentricity, diameter and spark-testing. Downstream, EPCs,

cable assemblers and installers integrate these single core solar cables into rooftop and utility-scale PV plants, connecting modules, string combiners, inverters and DC protection devices; distributors and wholesalers hold stock in standard cross-sections (e.g. 4, 6, 10, 16 mm?). Grid operators, IPPs and asset owners rely on cable performance for long-term energy yield and safety, while failures, field feedback and evolving codes (e.g. fire protection, dc-arc requirements, recyclability) feed back into midstream design choices and upstream material specifications, including interest in aluminium-conductor options and more recyclable, halogen-free compounds.

The global Single Core Solar Cable market size was estimated at USD 4238.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 7.30% during the forecast period.
