Report Overview:

The single crystal furnace is a kind of equipment that melts polycrystalline materials such as polycrystalline silicon with a graphite heater in an inert gas environment, and grows a dislocation-free single crystal by the Czochralski method. The single crystal furnace is composed of furnace body, thermal field, magnetic field, control device and other components. After the silicon material is refined and purified into high-purity polycrystalline silicon, it is necessary to obtain single crystal silicon rods in the single crystal furnace. The thermal field controlling the temperature in the furnace And the magnetic field that controls the crystal growth shape is the key to determine the production capacity of the single crystal furnace.

The Global Single Crystal Furnace Equipment Market Size was estimated at USD 3354.01 million in 2023 and is projected to reach USD 4122.94 million by 2029, exhibiting a CAGR of 3.50% during the forecast period.
