Abstracts

Single crystal NCM ternary precursor is a key raw material used for preparing single crystal NCM ternary cathode materials. It has the following characteristics: single crystal NCM ternary precursor is a hydroxide co precipitation compound containing nickel, cobalt, and manganese, and its particles exhibit a single crystal structure, that is, each particle has only one lattice direction. There are two main methods for preparing single crystal NCM ternary precursors: one is based on a controllable particle size reactor, which achieves uniform growth and separation of single crystal particles by controlling reaction conditions and flow rate; The other is based on micro lotion technology, which realizes the directional crystallization and dispersion of single crystal particles by dispersing oil droplets in the water phase. Single crystal NCM ternary precursors have higher structural stability, high temperature resistance, cycle life, and charge discharge performance compared to polycrystalline NCM ternary precursors, which can improve the energy density and safety of ternary cathode materials. Single crystal NCM ternary precursors are mainly used to prepare ternary cathode materials with high nickel content, such as NCM811, NCA, etc.

The global Single Crystal Ncm Ternary Precursor market size was estimated at USD 2850.42 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 12.45% during the forecast period.
