Abstracts

A single crystal silicon pressure sensor is a pressure measuring device that works based on the piezoresistive effect of single crystal silicon material. It uses the resistance change caused by the crystal structure of single crystal silicon when it is subjected to external force to measure pressure. Specifically, a single crystal silicon pressure sensor is usually made of a single crystal silicon wafer, on which pressure sensitive elements are formed through a specific process. These elements will undergo slight deformation when subjected to pressure, resulting in a change in resistance value. By measuring this resistance change and converting it into a corresponding electrical signal, accurate measurement of pressure can be achieved.

The global Single Crystal Silicon Pressure Sensor market size was estimated at USD 15200.0 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 10.10% during the forecast period.
