Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Single Cut Shear competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. Single-cut shears are electric or manual shearing tools used for cutting metal sheets. They are characterized by the fact that only one side of the blade moves actively during the shearing process, while the other side serves as a fixed support to achieve single-sided cutting. Compared with double-edged shears or punching shears, single-cut shears do not remove metal materials during operation, but directly separate the sheets through sliding shearing. The cutting seam is narrow and the edges are neat, which is suitable for fast cutting of long straight lines and slightly curved areas. This tool is widely used in sheet metal processing, HVAC engineering, metal roof installation, and automobile body repair. It is often used to shear thin steel plates, stainless steel, aluminum plates, etc. It has both cutting efficiency and edge quality. It is a common basic shearing equipment in industrial and professional applications.

The global Single Cut Shear market size was estimated at USD 144.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 4.60% during the forecast period.
