## Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Single Effect Adsorption Chiller competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. The global sales of Single Effect Adsorption Chillers reached approximately 11.5 thousand units in 2024, with an average selling price of \$86,500 per unit. This product is an environmentally friendly refrigeration unit that utilizes low-grade heat sources (such as industrial waste heat, solar hot water, and geothermal water) as the driving energy. It operates on an adsorption-desorption cycle between an adsorbent (e.g., silica gel, zeolite) and a refrigerant (e.g., water) to produce a cooling effect. Its core advantage lies in converting waste heat into useful cooling capacity, significantly reducing electricity consumption. It operates quietly without vibration and uses water as a non-toxic, eco-friendly refrigerant. It is primarily applied in industrial waste heat recovery, solar air conditioning, and district cooling systems where there is a simultaneous demand for substantial cooling capacity and access to a stable, low-cost heat source, making it a crucial technology for industrial energy efficiency and carbon emission reduction.

The global Single Effect Adsorption Chiller market size was estimated at USD 995.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 8.30% during the forecast period.
