Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Single-end Roving competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. In 2024, global single-end roving production reached approximately 162 kilotons, with an average global market price of around US\$ 1600 per ton. Single-end roving in the field of composite materials, especially glass fiber single-end roving, is a high-performance basic reinforcement materials. Its core definition lies in the unique preparation process: multiple continuous glass fiber filaments are directly drawn from a bushing with a specific number of holes, and after applying a special sizing agent, they are directly bundled in parallel and wound into a single yarn group without twisting. The annual production capacity of single-end roving per line typically ranges from 1,000 to 3,000 tons, with a gross profit margin of around 25%. Downstream consumption of single-end roving is concentrated in construction (29%), transportation (22%), electronics (16%), industrial equipment (21%), and other sectors (12%).

Market Concentration and Key Players: Internationally, single-ended roving market concentration is relatively high, mainly concentrated in Europe, America and Japan and other developed countries. For example, Johns Manville and Owens Corning and other large manufacturers; from the domestic point of view, single-end roving still has a lot of room for development.

Manufacturing Process and Market Trends: The single-end roving production process begins with the melting of glass batch materials to form homogeneous glass melt, followed by high-speed drawing of continuous fiber monofilament through platinum-rhodium alloy bushing, and the monofilament is coated with wetting agent and quickly bundled to form a parallel roving without twist. Finally, it is directly wound into bobbin yarn under precise tension control. Current market trends show that its demand is closely linked to the expansion of the composite material

industry, especially in the field of wind turbine blades, lightweight automobile parts and high-pressure pipes. This is due to its excellent resin permeability and mechanical strength. Global energy transition policies are continuously driving the growth of this market. Technological development focuses on higher strength and lower breakage rate production processes, as well as the application of environmentally friendly materials such as biodegradable wetting agents. The future market will be more inclined to high-performance and customized product solutions.

The global Single-end Roving market size was estimated at USD 260.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 5.60% during the forecast period.
