Abstracts

A single envelope worm gear is a specialized type of worm gear system in which the worm wheel (gear) is designed with a concave, enveloping shape that wraps partially around the worm (screw), increasing the contact area between the mating components. This design enhances load distribution, reduces stress concentrations, and improves torque transmission efficiency compared to non-enveloping worm gears. The single envelope configuration typically refers to the gear enveloping the worm, while the worm itself remains cylindrical, striking a balance between performance and manufacturing complexity. These gears are primarily used in applications requiring high reduction ratios, compact design, smooth operation, and shock load resistance, such as in conveyor systems, lifts, packaging machinery, and heavy industrial equipment where precise motion control and durability are critical.

The global Single Envelope Worm Gear market size was estimated at USD 315.4 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 4.15% during the forecast period.
