Abstracts

A single fan graphics card is a type of dedicated graphics processing unit (GPU) designed for desktop computers, characterized by a compact cooling system that utilizes a single axial fan to dissipate heat generated during operation. These cards are engineered with a smaller form factor compared to multi-fan models, making them suitable for systems with limited physical space, such as small form factor (SFF) or mini-ITX builds, where airflow and clearance constraints are critical considerations. While they generally offer lower thermal and acoustic performance than dual or triple-fan designs, single fan GPUs balance cooling efficiency with size and power consumption, typically targeting entry-level to mid-range performance tiers rather than high-end gaming or professional workloads. Their design prioritizes cost-effectiveness and compatibility, appealing to budget-conscious consumers, office environments, or users with modest graphical demands who seek a balance between functionality and physical footprint.

The global Single Fan Graphics Card market size was estimated at USD 2325.0 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of -2.75% during the forecast period.
