Abstracts

A single-frequency distributed feedback (DFB) laser is a semiconductor laser diode engineered to emit a highly stable, narrow-linewidth output at a single longitudinal mode, achieved through an integrated diffraction grating structure within the laser cavity that provides wavelength-selective feedback and suppresses multi-mode oscillations. These lasers are characterized by their precise wavelength control, low phase noise, and exceptional coherence properties, making them indispensable in applications requiring high spectral purity, such as fiber-optic communications (particularly in dense wavelength division multiplexing systems), high-resolution spectroscopy, LIDAR systems, interferometric sensing, and atomic physics experiments where minimal frequency drift and narrow linewidth are critical for performance.

The global Single Frequency Dfb Laser market size was estimated at USD 125.5 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 8.75% during the forecast period.
