Abstracts

A single-frequency narrow linewidth fiber laser is a laser that generates a single frequency and has a narrow linewidth. It usually uses optical fiber as the laser medium and achieves single-frequency and narrow linewidth output through specific design and modulation technology. The main features of single-frequency narrow linewidth fiber lasers include: Single-frequency output: It only produces laser output at a specific frequency and does not produce stray light at other frequencies. This makes it very useful in some applications that require stable single-frequency lasers, such as fiber optic sensing, spectral analysis, and optical interference. Narrow linewidth: Its output light width is relatively narrow, usually in the range of several gigahertz. The characteristics of narrow linewidth make it very important in some applications that require high resolution and precise frequency control, such as optical frequency synthesis, optical clocks and optical communications. High frequency stability: It has high frequency stability, that is, the output frequency is relatively stable and not easily affected by the external environment. This is very important for some applications that require stable operation for a long time.

The global Single Frequency Narrow Linewidth Fiber Laser market size was estimated at USD 760.42 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 8.75% during the forecast period.
