Abstracts

A single girder gantry crane is an overhead lifting system characterized by a single horizontal beam (the girder) supported by two vertical legs that run on rails or wheels along the ground, allowing the crane to traverse a work area without requiring a fixed runway system or overhead support structure. The hoist and trolley mechanism moves along the bottom flange of the girder, enabling lifting, lowering, and horizontal movement of loads within the defined span. These cranes are primarily used for outdoor applications, such as in shipping yards, construction sites, warehouses without adequate roof support, and manufacturing facilities, where their mobility, ease of installation, and cost-effectiveness compared to double girder or overhead bridge cranes make them a practical solution for handling moderate loads typically up to 20 tons. Their design offers flexibility in operation across uneven or outdoor terrain, and they are often customized with features like adjustable span widths, variable lifting heights, and power options (manual, electric, or radio-controlled) to suit specific operational requirements.

The global Single Girder Gantry Crane market size was estimated at USD 1250.6 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 4.85% during the forecast period.
