Abstracts

A single hole exhaust valve is a mechanical device designed to automatically release trapped air from liquid-carrying pipelines or closed systems, featuring a single outlet orifice through which air escapes when internal pressure exceeds a predetermined threshold; these valves operate on a float mechanism that rises with liquid levels to seal the outlet and drops when air accumulates, opening the valve to vent the air, thereby preventing airlocks, reducing corrosion, minimizing noise, and maintaining system efficiency in applications such as heating systems, water supply networks, industrial pipelines, and fire protection systems.
