Abstracts

Single layer ceramic capacitors offer high maximum operating voltage, with typical values of the order of 10 kilovolts (kV). That makes them usable in high voltage applications. Ceramic capacitors use ceramic materials as dielectric and metallic materials as electrodes. Single layer ceramic capacitor is formed by three-layer structure (metallic-ceramic-metallic) with two metallic terminals on a single layer (chunk) of ceramic. They are non-polarized so they may be connected either to positive or negative voltage. Single layer ceramic capacitor is larger than a multilayer ceramic capacitor with the same capacitance, so it may not be appropriate when miniaturization is important. The use of ceramic material limits the mechanical durability of ceramic capacitors. Single layer ceramic capacitors have better mechanical durability than multilayer ceramic capacitors because they include a larger chunk of ceramic, whereas multilayer capacitors include many thin layers of ceramic. Single-layer capacitors are electronic components designed with two electrical conductors separated by an insulating material, suitable for high-frequency decoupling in switching circuits due to their inductance and series resistance. It is a surface mount or through-hole capacitor, widely used in data processing, telecommunications, hard disks, personal computers, gaming computers, video cameras, DVDS, mobile phones, general electronic circuits and other capacitor applications.

The global Single Layer Capacitor market size was estimated at USD 8039.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 6.90% during the forecast period.
