## Abstracts

Single Layer Stretch Film Making Machine is a specialized piece of equipment designed to produce stretch film, specifically in a single-layer configuration. This machine operates by extruding a molten plastic resin, typically polyethylene (PE) or a related polymer, through a die to form a continuous sheet of film. The unique aspect of this machine lies in its ability to create the film in just one layer, which can then be stretched either during or after the extrusion process to impart elastic properties. Stretch films are widely used for packaging, fixing, and protecting various items during storage, transportation, and handling, thanks to their ability to conform tightly to the shape of the objects they cover and provide a secure hold. The single-layer construction of the film, produced by this machine, ensures a balance of cost-effectiveness, performance, and recyclability, making it suitable for a broad range of applications across different industries.

The global Single Layer Stretch Film Making Machine market size was estimated at USD 1109.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 3.40% during the forecast period.
