Report Overview

Single-mode photonic crystal fiber is a special type of fiber with a complex refractive index distribution on its cross-section and usually contains periodically arranged air holes. The size of these air holes is roughly equivalent to the wavelength of the light wave. The characteristic of single-mode photonic crystal fiber is that it can support only one mode of transmission in a wide wavelength range, that is, the light has only one propagation direction and vibration mode, and no mode coupling or energy propagation to other modes will occur. Single-mode photonic crystal fiber has many unique properties and applications, such as achieving hollow-core low-loss transmission, enhancing nonlinear effects, controlling dispersion and birefringence, etc.

This report provides a deep insight into the global Single-Mode Photonic Crystal Fiber market covering all its essential aspects.
