### Report Overview

Single Nucleotide Polymorphism (SNP) Genotyping is the measurement of genetic variations of single nucleotide polymorphisms (SNPs) between members of a species. It is a form of genotyping, which is the measurement of more general genetic variation. SNP genotyping is not only the genetic markers present in most, but also the most promising markers. SNP genotyping as the most potential for development of molecular markers, it can achieve large-scale highly automated, thus it is more suited to a huge number of detection and analysis, has been widely used in biology, agriculture, medicine, biological evolution and other fields.
