## Abstracts

A single pass honing machine is an advanced, highly automated industrial tool designed to perform precision honing operations in a single, continuous pass of the workpiece through the machine, eliminating the need for multiple reciprocating strokes. This process ensures superior surface finish, exceptional geometric accuracy (including roundness, straightness, and size control), and high material removal rates, making it particularly suitable for high-volume production environments such as automotive, aerospace, and hydraulic component manufacturing. By integrating in-process gauging and closed-loop feedback systems, these machines automatically adjust honing tool expansion in real-time to maintain tight tolerances, significantly reducing cycle times, labor costs, and variability compared to traditional honing methods. Key components typically include a rigid machine structure, precision spindles, automated workpiece handling, and advanced CNC controls, all working in unison to deliver consistent, repeatable results for bore finishing applications.

The global Single Pass Honing Machine market size was estimated at USD 185.0 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 4.50% during the forecast period.
