Abstracts

A single-phase brushless motor is a type of electric motor that operates on single-phase AC power and utilizes electronic commutation rather than brushes and a mechanical commutator, making it more efficient, reliable, and durable than brushed alternatives. It consists of a stationary stator with windings and a permanent magnet rotor, with its operation managed by an integrated controller that precisely times the switching of current in the stator windings to generate rotational motion. These motors are valued for their compact design, smooth operation, low maintenance requirements, and ability to provide variable speed control, making them suitable for a wide range of applications where efficiency, noise reduction, and longevity are critical.

The global Single Phase Brushless Motor market size was estimated at USD 2150.0 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 6.50% during the forecast period.
