Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Single-phase Direct-To-Chip Cooling competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. Single-phase direct-to-chip cooling is an efficient thermal management technology that uses a liquid coolant to directly contact electronic components to absorb and transfer heat in real time. This technology typically employs water-based or dielectric fluids that circulate in a single-phase state within the system, absorbing heat and releasing it through cooling devices. Compared to traditional air cooling methods, single-phase direct-to-chip cooling provides higher thermal conduction efficiency and is suitable for high power density and high-performance computing environments. Its advantages include reduced energy consumption, improved heat dissipation efficiency, and extended equipment lifespan, making it a significant advancement in modern electronic device thermal management. In 2024, the average price of single-phase direct-to-chip cooling was \$900, and the production volume was approximately 1.44 million units.

The global Single-phase Direct-To-Chip Cooling market size was estimated at USD 1300.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 18.00% during the forecast period.
