Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Single Phase Electric Hoist competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. A single-phase electric hoist is a small electric lifting device that uses single-phase alternating current (usually 220V) as a driving power source. The device has a compact structure and is easy to operate. It is generally composed of a single-phase motor, a reduction mechanism, a drum or sprocket, a wire rope or chain, a hook, a control switch and other components, which can realize vertical lifting and short-distance transportation of materials. Compared with three-phase electric hoists, single-phase electric hoists have the advantages of convenient power connection, small size, light weight and low cost. They are particularly suitable for use scenarios in civil or light industrial environments where power requirements are not high. Common product types include wire rope type, chain type, mini type, remote control type, etc. The rated lifting capacity ranges from 100kg to 500kg, and the lifting height can be customized according to the length of the wire rope. With the growth of "family-style logistics processing", "lightweight manufacturing" and the demand for automation transformation of small and medium-sized enterprises, the application of single-phase electric hoists in the global light-load lifting market is expanding, becoming an important tool to promote convenient and low-cost material handling.

The global Single Phase Electric Hoist market size was estimated at USD 597.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 8.30% during the forecast period.
