Report Overview:

A single-phase immersion cooling system sees servers vertically installed in a coolant bath of circulating hydrocarbon dielectric fluid. This fluid shares many properties with mineral oil. The coolant comes into direct contact with the server components, thus enabling the heat to be transferred. It stays a liquid and is cooled in a cooling distribution CDU by the heat exchanger. The heated coolant exits the rack via the top before the coolant returns via the heat exchanger, while the CDU features a coolant pump. Since it is difficult to determine the price of this product, this report only counts the income data. In addition, because some enterprises only started producing the product in recent one or two years, the data of some enterprises are only available in recent one or two years.

The Global Single-Phase Immersion Cooling System Market Size was estimated at USD 90.26 million in 2023 and is projected to reach USD 456.16 million by 2029, exhibiting a CAGR of 31.00% during the forecast period.
