Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Single-Phase Low-Voltage Off-Grid Inverter competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. In 2024, production of single-phase low-voltage off-grid inverters reached 97,686 units, with an average selling price of \$1,050 per unit. The annual production capacity of single-phase high-voltage energy storage inverters is approximately 6,000 units per line, with a gross profit margin of approximately 35.7%. A single-phase low-voltage off-grid inverter is a device that converts low-voltage DC power (typically from a small battery pack or other low-voltage energy storage unit) into AC power and independently supplies it to the load. Unlike grid-connected inverters, off-grid inverters do not feed power into the public grid, but instead provide stable AC power to local loads. They are commonly used in remote areas, emergency power supply, and small residential/commercial applications. Upstream raw materials for single-phase low-voltage off-grid inverters include low-voltage DC input and protection components, power electronics and conversion core components, and battery management and energy management components. The midstream segment comprises single-phase low-voltage off-grid inverter manufacturers, while the downstream segment primarily targets residential, commercial, and small industrial applications.

The global Single-Phase Low-Voltage Off-Grid Inverter market size was estimated at USD 103.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 4.30% during the forecast period.
