Abstracts

A single-phase recloser is an automated, self-contained circuit protection device designed to interrupt and reclose electrical circuits upon detecting temporary faults (such as tree branches or lightning strikes) while isolating permanent faults to minimize outage duration and improve grid reliability. It is commonly used in rural and suburban distribution networks where single-phase lines serve scattered loads, allowing utilities to reduce operational costs, enhance power quality, and limit the impact of faults to smaller sections of the grid without manual intervention. These devices typically integrate sensors, control logic, and interrupting mechanisms in a compact form factor, supporting features like fault detection, communication for remote monitoring, and customizable reclosing sequences to adapt to varying grid conditions.

The global Single Phase Recloser market size was estimated at USD 240.0 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 3.50% during the forecast period.
