Abstracts

A single-photon camera is a highly sensitive imaging device that uses a single photon for image acquisition. Single-photon cameras have higher sensitivity and lower noise levels than conventional imaging devices, are able to image in low-light conditions, and can capture very brief pulses of light. This makes single-photon cameras widely used in various fields, such as biomedicine, infrared imaging, etc. The single-photon camera market is currently in a fast-growing phase, benefiting from growing demand in areas such as quantum technology, low-light imaging, and precision measurement, with applications such as quantum communications, biomedical imaging, night vision, LiDAR, and astronomical observations. With the advancement of single-photon detection technology, especially the maturity of the near-infrared and visible bands, the market is gradually expanding to a wider range of wavelengths such as the mid-infrared. North America, Europe, and Asia-Pacific are the major markets, with scientific research institutions, defense, and medical industries being the major drivers. Although the high cost and technical threshold limit large-scale commercialization, with the advancement of technology and the reduction of costs, the future market potential is huge.

The global Single Photon Camera market size was estimated at USD 118.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 6.30% during the forecast period.
