Abstracts

The single photon emission computerized tomography (SPECT) systems are known to be generally the imaging devices that can create pictures or scans utilizing a combination of gamma rays and tomography, particularly in medicine. Because the SPECT system can see the cerebral blood flow, it is majorly used to detect abnormalities or diseases affecting brain function. The single photon emission computerized tomography (SPECT) probes market is expected to grow in the future due to advancements in image processing algorithms and hardware technologies. Shorter imaging times and higher resolutions have resulted from rapid advances in nuclear medicine diagnostics and continuous improvements in SPECT imaging technology. Single Photon Emission Computed Tomography (SPECT) is a nuclear medicine imaging technique used to detect and locate radiotracers in the body. SPECT probes typically consist of radionuclides, carriers, and markers that are used to introduce radionuclides into the body and track their distribution in the body.

The global Single Photon Emission Computerized Tomography (SPECT) Probes market size was estimated at USD 662.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 4.90% during the forecast period.
