Abstracts

Single Plane Illumination Microscopy (SPIM) is an optical microscopy technique that uses a single plane of light to illuminate the sample for efficient 3D imaging. SPIM focuses a laser or other light source into a thin plane of light, illuminating specific sections of the sample perpendicular to the observation axis. Unlike traditional confocal microscopy, SPIM scans and captures high-contrast images without illuminating the entire sample, minimizing light-induced damage and thermal effects. The selective illumination of only the observed section allows SPIM to provide high optical resolution and contrast, making it ideal for live-cell imaging, developmental biology research, and other applications where fast and low photodamage imaging is required.

The global Single Plane Illumination Microscopy (SPIM) market size was estimated at USD 71.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 6.30% during the forecast period.
