Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Single Pulse Transcranial Magnetic Stimulator competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. The Single Pulse Transcranial Magnetic Stimulator (sTMS) is a non-invasive neuromodulation device leveraging electromagnetic induction to induce spatiotemporally specific electric fields on the cranial surface via transient high-intensity magnetic pulses, enabling sub-millisecond precision activation or suppression of neuronal populations for localized neural circuit modulation with single-pulse resolution. The system employs a high-energy capacitor discharge unit and superconducting/amorphous magnetic core coils, coupled with dynamic impedance matching to optimize magnetic focality (?1 cm?) while suppressing off-target effects. Its real-time magnetic field monitor integrates Hall-effect sensors and 3D simulation algorithms to dynamically calibrate stimulation parameters, ensuring waveform-to-membrane potential threshold alignment. The device incorporates multimodal signal interfaces (EEG/EMG/fNIRS) for simultaneous causal analysis of neuromodulatory effects, serving as a high-resolution experimental tool for neuroscience, rehabilitation, and brain-machine interface research, advancing brain function mapping and neurological intervention toward precision and personalization.

The global Single Pulse Transcranial Magnetic Stimulator market size was estimated at USD 63.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 16.00% during the forecast period.
