Report Overview:

The computer-controlled dialysis machine is one of the most important products in the treatment of chronic renal patients and, in hemodialysis, it takes over a number of key functions – it pumps blood from the patient's body through the blood lines to the dialyzer (artificial kidney or filter). There, a fluid known as dialysate transports the toxins and excess water filtered from the blood away from the body. The fluid is introduced against the flow of blood through a separate circuit that is also controlled by the dialysis machine. In addition, the device injects drugs (such as Heparin) that restrain coagulation. The system has a number of automatic monitoring and control functions that ensure a safe and efficient dialysis treatment for patients. Hemodialysis Machine with Single Pump. Hemodialysis machines have been developed that are small enough to allow patients to travel. They feature easy setup via cartridge and easy cleaning after use.

The Global Single Pump Hemodialysis Machine Market Size was estimated at USD 783.14 million in 2023 and is projected to reach USD 957.11 million by 2029, exhibiting a CAGR of 3.40% during the forecast period.
