Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Single Pump competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. In 2024, global production of single pumps is 2.607 million units, with an average selling price of US\$280 per unit. A single pump is a pump system consisting of a single pump body, typically including a drive unit (such as a motor), a pump head, and necessary connecting piping. Unlike multi-pump or parallel pump systems, single pumps offer a simpler structure and easier maintenance, making them suitable for applications requiring relatively stable flow and head. Their operating principle is typically based on centrifugal force, positive displacement, or other pumping mechanisms, converting mechanical energy into kinetic or potential energy of the liquid, thereby achieving fluid transport or pressure boosting. Single pumps are widely used in industry, agriculture, municipal administration, construction, and other fields, and are one of the most common pump types. They can be horizontal or vertical, driven by electric, diesel, or pneumatic power, offering excellent versatility and cost-effectiveness. The single-line production capacity is approximately 200,000 units.

The global Single Pump market size was estimated at USD 730.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 4.00% during the forecast period.
