Abstracts

A single-shot autocorrelator is an advanced optical measurement instrument specifically designed to characterize ultrafast laser pulses by providing a real-time, single-pulse measurement of their temporal intensity profile and duration, typically in the femtosecond to picosecond range, without requiring repetitive sampling or scanning mechanisms. Unlike traditional scanning autocorrelators that rely on averaging multiple pulses over time, this device captures and analyzes each individual pulse event through techniques such as second-harmonic generation (SHG) or two-photon absorption (TPA) in a non-collinear geometry, often combined with a camera or array detector to spatially resolve the autocorrelation trace. It is particularly valuable in applications where pulse-to-pulse fluctuations, low repetition rates, or non-repetitive events must be studied, making it essential in fields such as ultrafast spectroscopy, laser development, plasma physics, and industrial laser processing where real-time feedback and stability monitoring are critical.

The global Single Shot Autocorrelator market size was estimated at USD 125.5 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 6.80% during the forecast period.
