### Report Overview

In most cases, an autocorrelation trace requires many different pulses from a regular pulse trains, since at least one pulse is required for every time delay setting, and a range of those must be scanned. However, it is also possible to measure a whole autocorrelation trace with a single pulse, if this has a sufficiently high pulse energy. A single-shot autocorrelator can be realized such that the focusing into the nonlinear crystal is done with a cylindrical (rather than spherical) lens, and the converted signal is recorded with a camera. Different spatial positions in the crystal then correspond to different time delays.
