Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Single-Stage Back Pressure Turbine competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. The single-stage back pressure turbine is a power device that directly drives mechanical equipment through steam heat energy. After completing the work, the remaining steam is directly discharged at a higher pressure (rather than condensed) for use in downstream processes (such as industrial heating, drying or chemical reactions). The single-stage back pressure steam turbine contains only one turbine stage, with a simple structure and low maintenance cost. The exhaust pressure is higher than the atmospheric pressure (usually 0.3-1.5MPa), high energy efficiency, and fast response. It is suitable for industrial self-contained power plants (petrochemical, textile, food processing), regional heating systems, biomass/waste power generation and other fields.

The global Single-Stage Back Pressure Turbine market size was estimated at USD 370.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 5.10% during the forecast period.

This report offers a comprehensive and in-depth analysis of the global Single-Stage Back Pressure Turbine market, covering all critical facets from a broad macroeconomic overview to detailed micro-level insights.
