Report Overview:

Single-stage desalination systems, also known as single-stage flash distillation systems, are a type of desalination system that use a single process step to convert seawater or brackish water into potable water.

In a single-stage desalination system, the water is first heated to the point where it begins to boil and convert to a vapor state. The vapor is then separated from the liquid phase and condensed back to a liquid state, producing fresh water. The remaining brine is rejected as waste.
