Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Single Stage Double Suction Pump competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. The single stage double suction pump is a centrifugal pump with suction ports on both sides of the single-stage impeller. Its structural design allows the liquid to enter the impeller from both sides of the pump body at the same time, effectively balancing the axial force and improving operational stability. Compared with ordinary single-suction pumps, double-suction pumps have higher flow delivery capacity and better hydraulic efficiency. They are widely used in industrial and municipal applications with large flows and low to medium heads, such as urban water supply, air conditioning circulation systems, thermal power station cooling water, irrigation, and large-scale industrial water treatment. This type of pump usually adopts an axially split open-type structure, which is easy to maintain and overhaul. The pump casing is horizontally split along the axis, and there is no need to disassemble the pipes and motors during overhaul. It is one of the key equipment in modern high-reliability water supply systems.

The global Single Stage Double Suction Pump market size was estimated at USD 3671.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 5.30% during the forecast period.
