Abstracts

A single stage spray dryer is an industrial apparatus designed to transform liquid feed materials into dry powders in a single drying phase. In this process, the liquid feed is atomized into fine droplets using either rotary or nozzle atomization techniques. These droplets are then introduced into a hot air stream within the drying chamber, where rapid moisture evaporation occurs, resulting in the formation of dry powder particles. The powder is subsequently collected from the bottom of the chamber or through separation systems like cyclones or bag filters. This method is widely utilized due to its efficiency in producing fine, uniform powders suitable for various industrial applications.?

The global Single Stage Spray Dryer market size was estimated at USD 514.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 3.90% during the forecast period.
