Abstracts

A single thyristor is a four-layer, three-terminal semiconductor device, which is the basic type in the thyristor family. Its core function is controllable unidirectional conduction, that is, after being triggered by a gate signal, it allows current to flow from the anode to the cathode, and it can remain on after the trigger signal disappears until the current drops below the holding current or the voltage between the anode and cathode reverses.

The global Single Thyristor market size was estimated at USD 687.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 3.50% during the forecast period.
