## Abstracts

The single USB port print server is a dedicated networking device designed to enable a standard USB printer, which lacks built-in network connectivity, to be shared across a local area network (LAN) or wireless network (Wi-Fi), allowing multiple users to send print jobs from their computers or mobile devices without requiring a direct physical connection to the printer itself; it typically functions by connecting to the printer via a USB interface and to the network via an Ethernet cable or Wi-Fi, translating print commands from networked devices into a format the printer can process, thereby extending the utility and accessibility of otherwise standalone printing hardware.

The global Single Usb Port Print Server market size was estimated at USD 112.5 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 4.75% during the forecast period.
