## Abstracts

Single-use cell bioreactors and fermenters are specialized bioprocessing equipment designed to grow cells or ferment microorganisms in a single-use configuration. In the case of single-use cell bioreactors, they provide a controlled environment for the growth of mammalian, microbial or plant cells, enabling the production of biopharmaceuticals such as monoclonal antibodies, recombinant proteins and vaccines. Similarly, single-use fermenters are used for the growth of bacteria, yeast, or other microorganisms to produce a variety of products including enzymes, biofuels, and organic acids. These single-use systems typically consist of disposable bioreactors or fermentation vessels made of materials such as plastic film or rigid polymers, as well as integrated sensors and ports for controlling parameters such as temperature, pH, dissolved oxygen and agitation. They eliminate the need for time-consuming and costly cleaning and sterilization procedures between batches, thus reducing the risk of cross-contamination and speeding up the entire production process. They are therefore ideally suited for applications where fast product changeover, flexibility and reduced downtime are essential, such as research and development, small-scale production and the production of personalized pharmaceuticals.

The global Single Use Cell Bioreactors And Fermenters market size was estimated at USD 771.3 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 7.10% during the forecast period.
