Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Single-use Syringe Filters competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. Single-use syringe filters is a membrane device attached to the end of a syringe. Used to remove particulate impurities from samples (liquids/gases) before certain types of analysis to prevent damage to equipment (such as HPLC, chromatographic ionization, etc.) ICP? Dissolution testing, etc., usually consists of a casing and a membrane used as a filter (classified according to composition, filter diameter, and pore size). The core part of a single-use syringe filters is the filter membrane. According to application requirements, the material and pore size of the filter membrane can vary. Common filter membrane materials include polyester (PET), polytetrafluoroethylene (PTFE), nylon, polycarbonate (PC), etc. Commonly used for the following applications: 1. Sample clarification: They can remove particles and debris from the sample, making it clearer and easier to analyze. 2. Aseptic filtration: They are used to sterilize small amounts of liquids, such as culture media, buffers, and solutions. They can remove bacteria, fungi, and other microorganisms, allowing samples to be safely used for cell culture and other sterile applications. 3. Sample preparation: They are used for sample preparation in analytical techniques such as HPLC (high-performance liquid chromatography) and GC (gas chromatography). They can remove impurities and particles that may interfere with the analysis. 4. Purification of biomolecules: They can be used to purify proteins, nucleic acids, and other biomolecules by removing contaminants and impurities from the sample. 5. Environmental testing: They can be used for environmental testing, filtering water, air, and soil samples. They can remove particles, microorganisms, and other pollutants from the sample, making it suitable for analysis. 6. Protein binding assays: They are used to

separate free and bound protein fractions. By passing the sample through a syringe filter, free proteins can be separated from proteins bound to other molecules.
