Abstracts

A single use tubular stapler is a specialized medical device designed for surgical anastomosis, primarily in gastrointestinal, thoracic, and bariatric procedures, where it is used to join tubular structures such as intestines or blood vessels through the simultaneous placement of a circular array of titanium staples and excision of excess tissue. These devices are engineered for one-time use to prevent cross-contamination, ensure sterility, and maintain mechanical reliability, typically featuring an integrated anvil, stapling mechanism, and safety interlocks. Key characteristics include varying staple heights and cartridge diameters to accommodate different tissue thicknesses and anatomical requirements, as well as ergonomic designs to facilitate precise placement and firing by surgeons. The product integrates advanced materials such as medical-grade plastics and alloys to balance durability with disposability, while modern iterations may include enhancements like powered firing systems or visual indicators to confirm proper tissue compression and staple formation.

The global Single Use Tubular Stapler market size was estimated at USD 1250.5 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 6.75% during the forecast period.
