Abstracts

A single wafer wet etcher is a semiconductor manufacturing equipment used for precise material removal and surface treatment processes on individual silicon wafers, employing chemical solutions to etch specific layers or clean residues with high uniformity and control. Unlike batch processing systems that handle multiple wafers simultaneously, single wafer etchers process one wafer at a time, offering superior process repeatability, reduced chemical consumption, and minimized cross-contamination risks, making them essential for advanced technology nodes where dimensional accuracy and defect control are critical. These systems are widely used in front-end-of-line (FEOL) and back-end-of-line (BEOL) processes, including oxide etching, metal layer removal, photoresist stripping, and post-etch cleaning, often integrated with megasonic or spray technologies to enhance performance.

The global Single Wafer Wet Etcher market size was estimated at USD 585.0 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 8.50% during the forecast period.
