Abstracts

Single wall carbon nanotube water-based dispersion is a solution where single-wall carbon nanotubes (SWCNTs) are uniformly dispersed in a water-based medium. Since single-wall carbon nanotubes have poor dispersion in water, surfactants, dispersing agents, or other additives are typically used to enhance their dispersion and prevent agglomeration. Water-based dispersions offer advantages such as environmental friendliness, low toxicity, and ease of handling. They are widely used in electronics, sensors, conductive coatings, composite materials, and other fields, particularly in applications that require low solvent content or meet environmental standards.

The global Single Wall Carbon Nanotube Water-Based Dispersion market size was estimated at USD 231.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 8.10% during the forecast period.
