Report Overview

Single-wavelength direct semiconductor laser is a special type of laser that works by using semiconductor materials to directly generate laser radiation. Compared with other types of lasers, single-wavelength direct semiconductor lasers have the advantages of compactness, high efficiency, low cost, and easy integration. Single wavelength means that the light output by the laser has only one specific wavelength, usually in the visible or infrared range. This property makes single-wavelength direct semiconductor lasers very useful in many applications, such as optical communications, optical storage, laser printing, laser medicine, and lidar. Direct semiconductor lasers produce laser radiation by injecting current into a semiconductor material to stimulate the recombination process of electrons and holes. This direct electro-optical conversion process enables direct semiconductor lasers to efficiently convert electrical energy into light energy and therefore have high efficiency. In addition, direct semiconductor lasers have the advantages of fast modulation speed, smaller size and lower power consumption, making them one of the key components in modern optoelectronics technology.
