## Abstracts

Singlebeam hydrographic echosounders, often referred to as singlebeam sonar systems or singlebeam sounders, are specialized instruments used in hydrography to measure water depth and map the seafloor or riverbed. These devices utilize the principle of echolocation, where sound waves are transmitted into the water and the time it takes for the signal to bounce back is used to calculate the water depth. Unlike multibeam echosounders, which use an array of beams to acquire swath coverage, singlebeam echosounders emit a single acoustic beam directly below the instrument.

The global Singlebeam Hydrographic Echosounders market size was estimated at USD 208.54 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 2.90% during the forecast period.
