Abstracts

Sinter metal components, or powder metallurgy parts, are metal parts manufactured through the process of sintering, which involves compacting metal powders into a desired shape and then heating them in a controlled atmosphere furnace at temperatures below the melting point of the metal, causing the particles to bond metallurgically without fully liquefying; this method enables the production of complex, near-net-shape components with high dimensional accuracy, controlled porosity, and excellent material utilization, making it particularly advantageous for mass production of parts like gears, bearings, filters, and structural components used across automotive, aerospace, industrial machinery, and consumer electronics sectors.
