Abstracts

Sintered bronze components are metal parts made through a powder metallurgy process. In this process, bronze powder (an alloy of copper and tin) is compacted into a specific shape and then heated (sintered) just below its melting point. The sintering binds the particles together, creating a solid and often porous structure. Sintered bronze components are often designed with controlled porosity, allowing them to be impregnated with lubricants. This makes them ideal for self-lubricating bearings in machinery, where they release lubricant over time, reducing maintenance and extending lifespan.

The global Sintered Bronze Components market size was estimated at USD 6041.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 3.40% during the forecast period.
