Abstracts

Sintered-Metal Self-Lubricating Bearing is a type of bearing that combines the strength and durability of sintered metal with the self-lubricating properties of embedded solid lubricants. Sintered metal bearings are made by compressing and heating metal powder to create a porous, yet strong, structure. These bearings are then infiltrated with solid lubricants, such as graphite, molybdenum disulfide, or polytetrafluoroethylene (PTFE), which provide lubrication during operation without the need for external lubrication. This self-lubricating feature reduces friction, wear, and heat generation, leading to longer bearing life and reduced maintenance requirements. Sintered-metal self-lubricating bearings are widely used in applications where traditional oil or grease lubrication is impractical or impossible, such as in vacuum environments, high-temperature conditions, or where contamination must be minimized.

The global Sintered Metal Self Lubricating Bearing market size was estimated at USD 1407.9 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 4.10% during the forecast period.
